Task 1 – Time 60 minutes
Write a 450-word essay to compare the use of alternative sources of energy, including wind and solar power and fossil fuels.

Comparison essay: Alternative sources of energy, fossil fuels

+ Economic factors: fossil fuels cost increase, initial set up cost >< alternative sources have a long term benefit for economy
+ Environmental impact: green, eco-friendly >< harmful impact on environment
+ Accessibility (khả năng tiếp cận)
  Wind and solar power: wind farm, solar panel, depend on climate

Intro: introduce the global need for energy and the shit from traditional fossil fuels to renewable green energy

Nowadays energy are divided into two main groups are renewable energy and fossil fuel. No matter what it cost, there is still remain some plus point and minus point with both energy. This essay use wind energy and solar power as reuseable fuel to compare with fossil fuel about the use of alternative sources.

Along with the increasing population worldwide, the global need for energy has also skyrocketed; as a result the sources of energy are becoming more and more important. For century, fossil fuels like coal, oil and gas have been the primary sources that power many households. However, as the world faces the growing threat of climate change, the transition from traditional energy to alternative sources has become a global priority. This essay will compare these energy sources in terms of economy, reliability and cost.
First of all
Coal => burn => CO2 => global warming => biodiversity
Renewable energy => green, eco friendly
First of all, when we burn fossil fuels such as gas, coal and so on, it will release CO2 into the air and may lead to global warming, causes

biodiversity loss. It may be different from the alternative energy like solar, wind energy which is generally more environmentally friendly than fossil fuels because they produce zero carbon emissions.
There are several similarities between coal and renewable energy. First, one key similarity is that both serve as vital resources for generating electricity to meet global demand. For example, many countries still rely on a mix of coal to maintain the operation of their electricity network for their citizens. Second, both fossil fuels and green energy sources require advanced technology . Another similarity is their impact on the economy. For instance, the development of both coal mining and wind farms creates thousands of jobs for engineers and local workers.

Sample
First of all, the most significant difference between two types of energy sources relies on environmental impact. While non-renewable energy such as coal, oil and gas is extremely convenient, it can release vast amounts of carbon dioxide when burned, which attributes to the problem of global warming. By contrast, renewable energy like solar and wind energy doesn’t produce any toxic fumes which is cleaner and better for not only environment but also human being. In addition, the process of exploiting fossil fuels can destroy local ecosystem whereas solar and wind energy are available and eco-friendly. For example, solar panels and wind turbines generate electricity without damaging the habit of local flora and fauna.
Secondly/The second/ Moreover, it is undeniable that economic factors also play an important role in deciding whether solar and wind energy or fossil fuels are favorable. Generally, fossil fuels were much cheaper to produce. However, the cost of solar and wind technology has dropped by over 80% in the last decade. While/ Although the initial investment for a wind farm or solar panel is high, the long term usage of these energies are free/ available. Fossil fuels, meanwhile, are subject to volatile market prices and political instability, which can lead to sudden energy crisis.

For example, during the escalating crisis between Iran and the USA, the energy market has dramatically fluctuated leading to the rising price of petroleum in many countries.

In conclusion,

advantage and disadvantage = pros and cons

In conclusion, although solar energy and fossil fuels have some pros and cons, they still have some differences on the environment and economy. While burning fossil fuels releases CO2 and damages ecosystems, renewable energy offers eco-friendly with decreased emissions. Despite the use of fossil fuels, it is convenient, I believe that changing renewable sources of energy is vital for protecting the environment and minimizing climate change. Quoc Dung

In conclusion, no matter what type of energy, it still has its own advantages and disadvantages. To summarize, renewable fuel can protect the environment better than fossil fuel but the cost to set up the platform to use renewable fuel is extremely high, while fossil fuel can be used with cheaper cost but can cause damage to the environment and in the most case, we need a lot of money to fix the damage. However every small change of both types can cause a huge impact on the environment and can cause fuel inflation or even economic inflation if nobody or no organization controls the sources of energy.* trung phan

In conclusion, both fossil fuels and renewable energy have their strengths and weakness. Both have differences in terms of environment and economy.
Fossil fuels remain economically convenient but cause severe environmental damage, while wind and solar power are cleaner and more sustainable yet require initial costs. The right path is strike a balance that meets energy need while safeguarding the environment for future generations. *Trâm

In conclusion, using alternative energy like wind, solar power and fossil fuels há some powerful impacts on the environment, economy, and society. …..But also with that, we need to control how we using the energy effectively *An*

In conclusion, while alternative energy and fossil fuels share some similarities, they also have clear differences. The similarities are their vital role in powering the global economy, their requirement for large-scale infrastructure, but they are different in their environmental impact and long-term sustainability. Overall, both options have their own strengths and

weaknesses, and the transition to greener energy will depend on balancing economic costs with environmental protection. ***Chiến***
